Events

There is differences in the event object returned by these three key events. They also differ in when they are fired: pressing and holding down a key will fire Keypress and Keydown until the key is released, at which point Keyup is fired. Lastly, keypress reports the actual key that went in to the text area, including accounting for shift modifier. Also note Keypress is never fired for modifier keys (Ctrl, shift)

Keypress   Keydown   Keyup
